

Sigma-7 400 V

Product Catalog

Quick. Fast. Reliable.

The 400 V series

Amplifier

- · Space saving bookstyle for side-by-side mounting
- Embedded fieldbus
 - » EtherCAT
 - » MECHATROLINK-III
- Single & dual axis amplifier
- European connectors
- Daisy-chain-connection

Motors

- Plug-and-turn connectors according to european standards (M12, M17, M23 and M40)
- Available from 200 W 15 kW

Seven Reasons for Sigma-7

The Sigma Series of Servo Drives has evolved into the Sigma-7 Servo Drives, which provides you with the ultimate experience in seven key areas and delivers the optimal solution that only YASKAWA can offer.

Comprehensive Motor and Amplifier Power Range

Wide power range

- ▶ Very compact motors from 200 W to 5 kW
- Linear motors iron core and ironless with a peak force up to 7,560 N

Savings through Performance

Lower production costs

- ➤ Speed loop bandwidth of 3.1 kHz
- Shorter settling time, reduced positioning time, higher throughput

No additional cooling necessary

➤ Ambient temperature -5 – 55 °C (max. 60 °C with derating)

Energy savings and higher productivity

- High peak torque, fast acceleration, no amplifier oversizing
- ▶ Lightweight mechanics

Higher performance

➤ Overload 350 % for 3 – 5 seconds

Safety Features

Smooth integration of mandatory legal safety standards

- ➤ The STO function is implemented by default in all Sigma-7 series servo amplifiers
- ▶ Build safer machines Sigma-7 satisfies the requirements of SIL 3 and PL-e
- ➤ The safety functions SS1, SS2 and SLS are integrated by using the safety module SGDV-OSA01A000FT900

High Efficiency

Very low heat generation

- Optimized magnetic circuit improves motor efficiency
- ► Improved motor efficiency reduces heat generation by about 20%

High Accuracy

Next level 24-bit absolute encoder for maximum accuracy

 Resolution of 16 million pulses per revolution for extremely precice positioning

Impressive System Performance

Very high precision teamed up with fast, smooth operation

- Ripple compensation for highest demands in smoothness and dynamics
- Even for machines for which speed loop gains cannot be set high

Outstanding Reliability

Even more reliability for your production

- More than 12 million servo systems in the field
- Improved machine reliability, reduced service and maintenance costs, less downtime

Servomotors

Rotary

SGM7J

- Medium inertia, high speed
- > 200W 1.5kW

SGM7A

- Low inertia, high speed
- > 200W 7.0kW

SGM7G

- Medium inertia, high torque, low speed or high speed models
- ▶ 450W 15kW

Linear

SGLFW2

- Model with F-type iron core
- Rated: 45N 2,520NPeak: 135N 7,560N

Specifications and Ratings

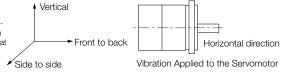

Specifications

	Voltage		40	0 V				
	Model SGM7J-	02D	04D	08D	15D			
Time Rating			Conti	nuous				
Thermal Class			[3				
Insulation Resis	stance		500 VDC, 10) MOhm min.				
Withstand Volta	age		1,800 VAC	for 1 minute				
Excitation			Permane	nt magnet				
Mounting			Flange-i	mounted				
Drive Method			Direc	t drive				
Rotation Directi	ion	Counterclockwise	e (CCW) for forward re	ference when viewed	rom the load side			
Vibration Class*1			V	15				
	Surrounding Air Temperature	0 °C to 40 °C (With derating, usage is possible between 40 °C and 60 °C)*4						
	Surrounding Air Humidity	20% to 80% relative humidity (with no condensation)						
Environmental Conditions	Installation Site	 Must be indoors and free of corrosive and explosive gases. Must be well-ventilated and free of dust and moisture. Must facilitate inspection and cleaning. Must have an altitude of 1,000 m or less. (With derating, usage is possible between 1,000 m and 2,000 m.)*5 Must be free of strong magnetic fields. 						
	Storage Environment	Store the Servomotor in the following environment if you store it with the power cable disconnected. Storage Temperature: -20 °C to 60 °C (with no freezing) Storage Humidity: 20% to 80% relative humidity (with no condensation)						
Shock Resis- Impact Acceleration Rate at Flange		490 m/s ²						
tance*2	Number of Impacts	2 times						
Vibration Re- sistance*3	Vibration Acceleration Rate at Flange	49 m/s ²						
Applicable SERVOPACKs	SGD7S-	1F	89D	3R5D	5R4D			

- *1. A Vibration class of V15 indicates a vibration amplitude of 15 µm maximum on the Servomotor without a load at the rated motor speed.
- *2. The shock resistance for shock in the vertical direction when the Servomotor is mounted with the shaft in a horizontal position is given in the above table.

*3. The vertical, side-to-side, and front-to-back vibration resistance for vibration in three directions when the Servo-motor is mounted with the shaft in a horizontal position is given in the above table. The strength of the vibration that the Servomotor can withstand depends on the application. Always check the vibration acceleration rate that is applied to the Servomotor with the actual equipment.

- *4. If the surrounding air temperature will exceed 40°C, refer to the section "Applications where the Surrounding Air Temperature of the Servomotor Exceeds 40°C".
- *5. If the altitude will exceed 1,000 m, refer to the section "Applications where the Altitude of the Servomotor Exceeds 1000m".

Note: The values in parentheses are for Servomotors with holding brakes.

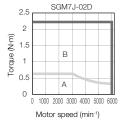

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. The values for other items are at 20°C. These are typical values.
- 2. The rated torques are the continuous allowable torque values at a surrounding air temperature of 40°C with an aluminum heat sink of the dimensions given in the table.
- 3. This does not apply to the shaft opening. Protective structure specifications apply only when the special cable is used.
- $4.\ \mbox{Observe}$ the following precautions if you use a Servomotor with a holding brake.
 - The holding brake cannot be used to stop the Servomotor.
 - The time required to release the brake and the time required to brake depend on which discharge circuit is used.
 Confirm that the operation delay time is appropriate for the actual equipment.
 - \bullet The 24-VDC power supply is not provided by YASKAWA.
- 5. The allowable shaft loads are illustrated in the following figure. Design the mechanical system so that the thrust and radial loads applied to the Servomotor shaft end during operation do not exceed the values given in the table.

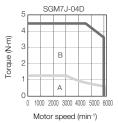

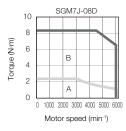

Motor Speed-Torque Characteristics

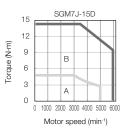

A: Continuous duty zone

B: Intermittent duty zone

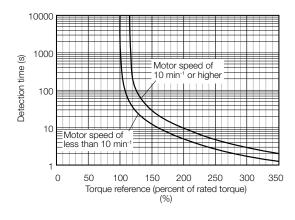

Notes:

- These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. These are typical values.
- The characteristics in the intermittent duty zone depend on the power supply voltage. The intermittent duty zones in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- 3. If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.
- If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torquemotor speed characteristics will become smaller because the voltage drop increases.

Servomotor Overload Protection Characteristics

The overload detection level is set for hot start conditions with a Servomotor surrounding air temperature of 40°C.

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher.

Use the Servomotor so that the effective torque remains within the continuous duty zone given in Motor Speed-Torque Characteristics above.

Rotary Servomotors SGM7J

Load Moment of Inertia

The load moment of inertia indicates the inertia of the load. The larger the load moment of inertia, the worse the response. If the moment of inertia is too large, operation will become unstable.

The allowable size of the load moment of inertia (J_L) for the Servomotor is restricted. Refer to Ratings of Rotary Serovmotors SGM7J. This value is provided strictly as a guideline and results depend on Servomotor driving conditions.

An Overvoltage Alarm (A.400) is likely to occur during deceleration if the load moment of inertia exceeds the allowable load moment of inertia. SERVOPACKs with a built-in regenerative resistor may generate a Regenerative Overload Alarm (A.320). Perform one of the following steps if this occurs.

- Reduce the torque limit.
- Reduce the deceleration rate.
- Reduce the maximum motor speed.
- Install an external regenerative resistor if the alarm cannot be cleared using the above steps.

Servomotor Heat Dissipation Conditions

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C when a heat sink is installed on the Servomotor. If the Servomotor is mounted on a small device component, the Servomotor temperature may rise considerably because the surface for

heat dissipation becomes smaller. Refer to the following graphs for the relation between the heat sink size and derating rate

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection

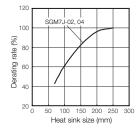

level of the motor. Refer to the Servomotor Overload Protection Characteristics.

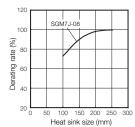

Note:

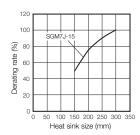

The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative.

Important:

The actual temperature rise depends on how the heat sink (i.e., the Servomotor mounting section) is attached to the installation surface, what material is used for the Servomotor mounting section, and the motor speed. Always check the Servomotor temperature with the actual equipment.

See Servomotor Ratings for more information.

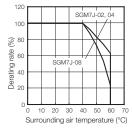

Applications Where the Surrounding Air Temperature of the Servomotor Exceeds 40°C

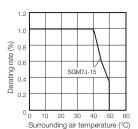

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C. If you use a Servomotor at a surrounding air temperature that exceeds 40°C (60°C max.), apply a suitable derating rate from the following graphs.

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the Servomotor Overload Protection Characteristics.

Note:

- Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.
- The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative.

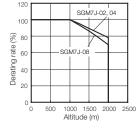

Applications Where the Altitude of the Servomotor Exceeds 1,000 m

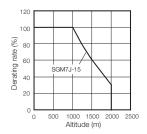

The Servomotor ratings are the continuous allowable values at an altitude of 1,000 m or less. If you use a Servomotor at an altitude that exceeds 1,000 m (2,000 m max.), the heat dissipation effect of the air is reduced. Apply the appropriate derating rate from the following graphs.

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the Servomotor Overload Protection Characteristics.

Note:

- Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.
- The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative.

 $^{^{\}rm +}1$ A Vibration class of V15 indicates a vibration amplitude of 15 μm maximum on the Servomotor without a load at the rated motor speed.

^{*2} The shock resistance for shock in the vertical direction when the Servomotor is mounted with the shaft in a horizontal position is given in the above table.

*3 The vertical, side-to-side, and front-to-back vibration resistance for vibration in three directions when the Servomotor is mounted with the shaft in a horizontal position is given in the above table. The strength of the vibration that the Servomotor can withstand depends on the application. Always check the vibration acceleration rate that is applied to the Servomotor with the actual equipment.

^{*4} Refer to the section "Applications where the Surrounding Air Temperature of the Servomotor Exceeds 40°C".

^{*5} If the altitude will exceed 1,000 m, refer to the section "Applications where the Altitude of the Servomotor Exceeds 1000m".

^{*6} If you use this combination, performance may not be as good, e.g., the control gain may not increase, in comparison with using a Sigma-7 Single Axis SERVOPACK.

Note: The values in parentheses are for Servomotors with Holding Brakes.

- *1. For the SGM7A-02D to SGM7A-10D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. The values for other items are at 20°C. For the SGM7A-15D to SG-M7A-30D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- *2. The rated torques are the continuous allowable torque values at a surrounding air temperature of 40°C with an aluminum heat sink of the dimensions given in the table.
- *3. This does not apply to the shaft opening. Protective structure specifications apply only when the special cable is used.
- *4. Observe the following precautions if you use a Servomotor with a Holding Brake.

 The holding brake cannot be used to stop the Servomotor.

 - The time required to release the brake and the time required to brake depend on which discharge circuit is used.
 Confirm that the operation delay time is appropriate for the actual equipment.
 - The 24-VDC power supply is not provided by YASKAWA.
- *5. The allowable shaft loads are illustrated in the following figure. Design the mechanical system so that the thrust and radial loads applied to the Servomotor shaft end during operation do not exceed the values given in the table.
- *6. For the SGM7A-25D, the maximum motor speed for the continuous duty zone is 5,000 min-1. Use the Servomotor within the continuous duty zone for the average motor speed and effective torque.

Rotary Servomotors SGM7A

Motor Speed-Torque Characteristics

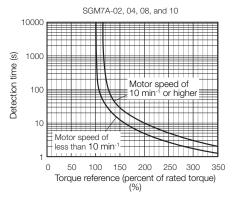

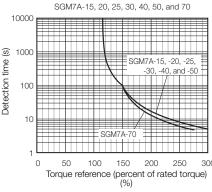

Note:

- For the SGM7A-02D to SGM7A-10D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C.
- For the SGM7A-15D to SGM7A-30D, these values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- The characteristics in the intermittent duty zone depend on the power supply voltage. The intermittent duty zones in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.
- If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torquemotor speed characteristics will become smaller because the voltage drop increases.

Servomotor Overload Protection Characteristics

The overload detection level is set for hot start conditions with a Servomotor surrounding air temperature of 40 °C.

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. Use the Servomotor so that the effective torque remains within the continuous duty zone given in Motor Speed-Torque Characteristics.

Load Moment of Inertia

The load moment of inertia indicates the inertia of the load. The larger the load moment of inertia, the worse the response. If the moment of inertia is too large, operation will become unstable.

The allowable size of the load moment of inertia (J_L) for the Servomotor is restricted. Refer to Ratings of Rotary Serovmotors SGM7J. This value is provided strictly as a guideline and results depend on Servomotor driving conditions.

An Overvoltage Alarm (A.400) is likely to occur during deceleration if the load moment of inertia exceeds the allowable load moment of inertia. SERVOPACKs with a built-in regenerative resistor may generate a Regenerative Overload Alarm (A.320).

Perform one of the following steps if this occurs.

- Reduce the torque limit.
- Reduce the deceleration rate.
- Reduce the maximum motor speed.
- Install an external regenerative resistor if the alarm cannot be cleared using the above steps.

Rotary Servomotors SGM7A

Servomotor Heat Dissipation Conditions

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C when a heat sink is installed on the Servomotor. If the Servomotor is mounted on a small device component, the Servomotor temperature may rise considerably because the surface for heat dissipation becomes smaller. Refer to the following graphs for the relation between the heat sink size and derating rate.

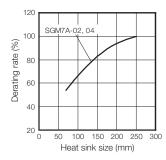

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics

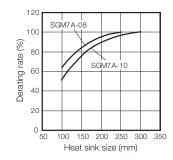

Note:

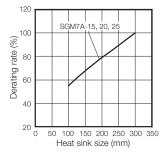

The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative.

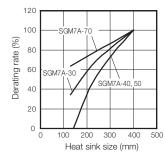

Important:

The actual temperature rise depends on how the heat sink (i.e., the Servomotor mounting section) is attached to the installation surface, what material is used for the Servomotor mounting section, and the motor speed. Always check the Servomotor temperature with the actual equipment.

See Servomotor Ratings for more information.

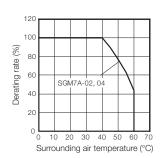

Applications Where the Surrounding Air Temperature of the Servomotor Exceeds 40°C

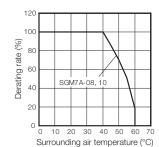

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C. If you use a Servomotor at a surrounding air temperature that exceeds 40°C (60°C max.), apply a suitable derating rate from the following graphs.

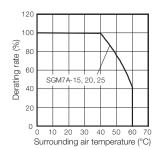

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

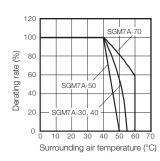

Note:

- Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.
- The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative.

Rotary Servomotors SGM7A

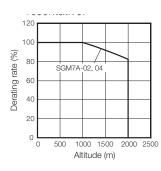

Applications Where the Altitude of the Servomotor Exceeds 1,000 m

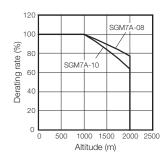

The Servomotor ratings are the continuous allowable values at an altitude of 1,000 m or less. If you use a Servomotor at an altitude that exceeds 1,000 m (2,000 m max.), the heat dissipation effect of the air is reduced. Apply the appropriate derating rate from the following graphs.

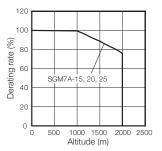

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

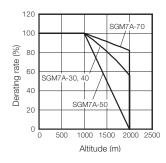

Note:

- Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.
- The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative.

^{*1.} A vibration class of V15 indicates a vibration amplitude of 15 µm maximum on the Servomotor without a load at the rated motor speed

^{*2.} The shock resistance for shock in the vertical direction when the Servomotor is mounted with the shaft in a horizontal position is given in the above table.

*3. The vertical, side-to-side, and front-to-back vibration resistance for vibration in three directions when the Servomotor is mounted with the shaft in a horizontal position is given in the above table. The strength of the vibration that the Servomotor can withstand depends on the application. Always check the vibration acceleration rate that is applied to the Servomotor with the actual equipment.

^{*4.} If the surrounding air temperature will exceed 40°C, refer to the section "Applications where the Surrounding Air Temperature of the Servomotor Exceeds 40°C".

^{*5.} If the altitude will exceed 1,000 m, refer to the section "Applications where the Altitude of the Servomotor Exceeds 1,000 m"

^{*6.} If you use this combination, performance may not be as good, e.g., the control gain may not increase, in comparison with using a Sigma-7S SERVOPACK.

Note:

The values in parentheses are for Servomotors with Holding Brakes.

- *1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- *2. The rated torques are the continuous allowable torque values at a surrounding air temperature of 40°C with an aluminum or steel heat sink of the dimensions given in the table.
- *3. This does not apply to the shaft opening. Protective structure specifications apply only when the special cable is used.
- *4. Observe the following precautions if you use a Servomotor with a Holding Brake.
- The holding brake cannot be used to stop the Servomotor.
- The time required to release the brake and the time required to brake depend on which discharge circuit is used. Confirm that the operation delay time is appropriate for the actual equipment.
- The 24-VDC power supply is not provided by YASKAWA.
- *5. The allowable shaft loads are illustrated in the following figure. Design the mechanical system so that the thrust and radial loads applied to the Servomotor shaft end during operation do not exceed the values given in the table.

Note

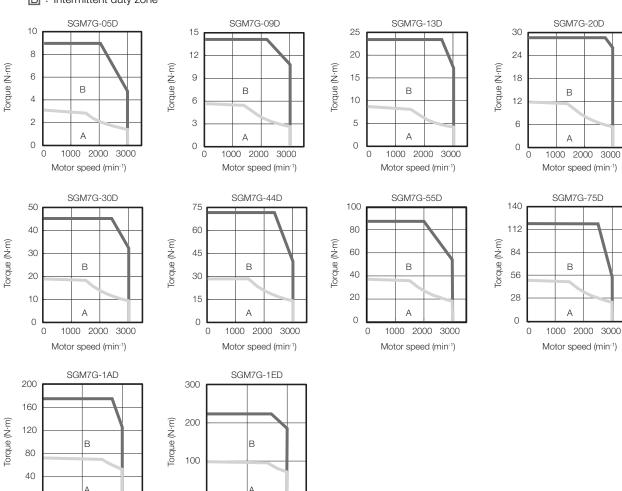

The values in parentheses are for Servomotors with Holding Brakes.

- *1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- *2. The rated torques are the continuous allowable torque values at a surrounding air temperature of 40°C with an aluminum or steel heat sink of the dimensions given in the table.
- *3. This does not apply to the shaft opening. Protective structure specifications apply only when the special cable is used.
- *4. Observe the following precautions if you use a Servomotor with a Holding Brake.
- The holding brake cannot be used to stop the Servomotor.
- The time required to release the brake and the time required to brake depend on which discharge circuit is used. Confirm that the operation delay time is appropriate for the actual equipment.
- The 24-VDC power supply is not provided by YASKAWA.
- *5. The allowable shaft loads are illustrated in the following figure. Design the mechanical system so that the thrust and radial loads applied to the Servomotor shaft end during operation do not exceed the values given in the table.

Motor Speed-Torque Characteristics Standard Servomotors

A : Continuous duty zoneB : Intermittent duty zone

Note:

1000

Motor speed (min⁻¹)

0

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- The characteristics in the intermittent duty zone depend on the power supply voltage. The intermittent duty zone in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- 3. If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.

0

1000

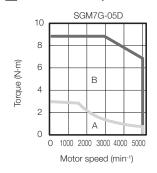

Motor speed (min-1)

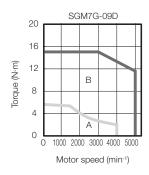

4. If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller because the voltage drop increases.

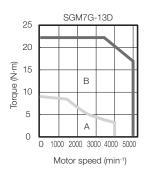

High-speed Servomotors

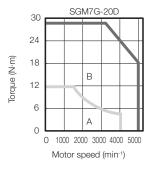

A: Continuous duty zone

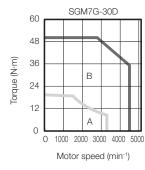

B: Intermittent duty zone

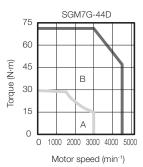

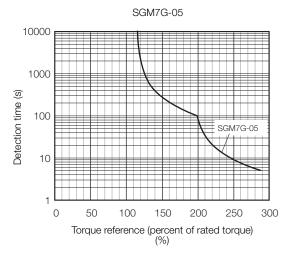

Note:

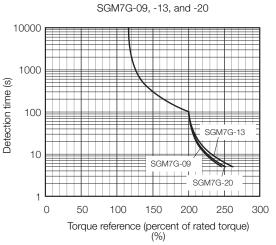

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 20°C. These are typical values.
- 2. The characteristics in the intermittent duty zone depend on the power supply voltage. The intermittent duty zone in the graphs show the characteristics when a three-phase, 400-VAC power supply voltage is used.
- 3. If the effective torque is within the allowable range for the rated torque, the Servomotor can be used within the intermittent duty zone.
- 4. If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller because the voltage drop increases.

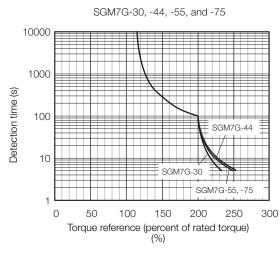

Servomotor Overload Protection Characteristics

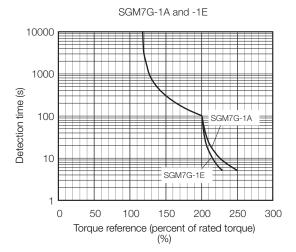

The overload detection level is set for hot start conditions with a Servomotor surrounding air temperature of 40 °C.

Standard Servomotors

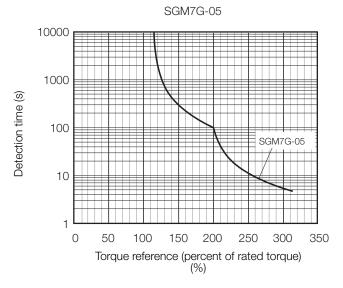

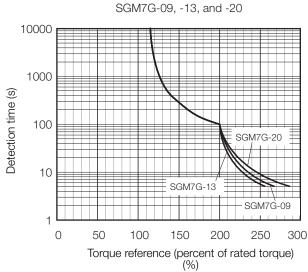

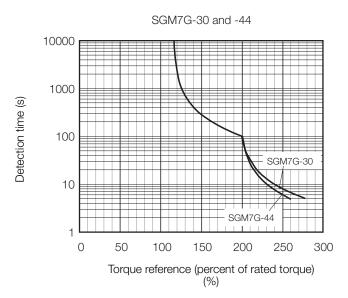

Note:

The overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. Use the Servomotor so that the effective torque remains within the continuous duty zone given in Motor Speed-Torque Characteristics.

High-speed Servomotors

Note:

The overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. Use the Servomotor so that the effective torque remains within the continuous duty zone given in Motor Speed-Torque Characteristics.

Load Moment of Inertia

The load moment of inertia indicates the inertia of the load. The larger the load moment of inertia, the worse the response. If the moment of inertia is too large, operation will become unstable.

The allowable size of the load moment of inertia (J_L) for the Servomotor is restricted. Refer to Ratings of Rotary Serovmotors SGM7J. This value is provided strictly as a guideline and results depend on Servomotor driving conditions.

An Overvoltage Alarm (A.400) is likely to occur during deceleration if the load moment of inertia exceeds the allowable load

moment of inertia. SERVOPACKs with a built-in regenerative resistor may generate a Regenerative Overload Alarm (A.320). Perform one of the following steps if this occurs.

- Reduce the torque limit.
- Reduce the deceleration rate.
- · Reduce the maximum motor speed.
- Install an external regenerative resistor if the alarm cannot be cleared using the above steps.

Servomotor Heat Dissipation Conditions

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C when a heat sink is installed on the Servomotor. If the Servomotor is mounted on a small device component, the Servomotor temperature may rise considerably because the surface for heat dissipation becomes smaller. Refer to the following graphs for the relation between the heat sink size and derating rate.

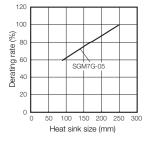

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

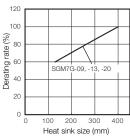

lote:

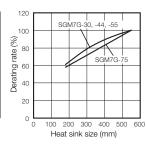

The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative.

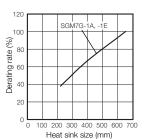

Important:

The actual temperature rise depends on how the heat sink (i.e., the Servomotor mounting section) is attached to the installation surface, what material is used for the Servomotor mounting section, and the motor speed. Always check the Servomotor temperature with the actual equipment.

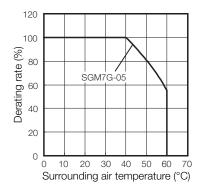

See Servomotor Ratings for more information.

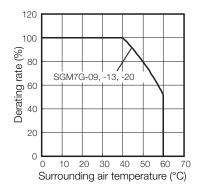

Applications Where the Surrounding Air Temperature of the Servomotor Exceeds 40°C

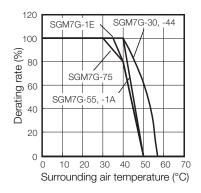

The Servomotor ratings are the continuous allowable values at a surrounding air temperature of 40°C. If you use a Servomotor at a surrounding air temperature that exceeds 40°C (60°C max.), apply a suitable derating rate from the following graphs.

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

- Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor.
- 2. The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative

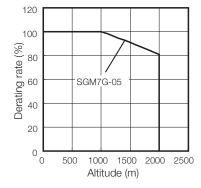

Applications Where the Altitude of the Servomotor Exceeds 1,000 m

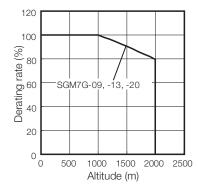

The Servomotor ratings are the continuous allowable values at an altitude of 1,000 m or less. If you use a Servomotor at an altitude that exceeds 1,000 m (2,000 m max.), the heat dissipation effect of the air is reduced. Apply the appropriate derating rate from the following graphs.

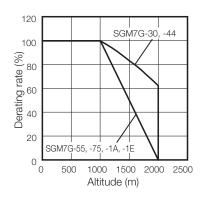

Also, change the overload warning and overload alarm detection timing in advance based on the overload detection level of the motor. Refer to the section Servomotor Overload Protection Characteristics.

Note:

- 1. Use the combination of the SERVOPACK and Servomotor so that the derating conditions are satisfied for both the SERVOPACK and Servomotor
- 2. The derating rates are applicable only when the average motor speed is less than or equal to the rated motor speed. If the average motor speed exceeds the rated motor speed, consult with your YASKAWA representative

Precautions on Moving Coils with Polarity Sensors

Note:

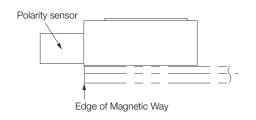

When you use a Moving Coil with a Polarity Sensor, the Magnetic Way must cover the bottom of the polarity sensor. Refer to the example that shows the correct installation.

When determining the length of the Moving Coil's stroke or the length of the Magnetic Way, consider the total length (L) of the Moving Coil and the polarity sensor. Refer to the following table.

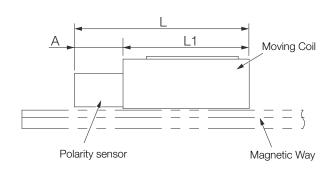

Correct Installation

Incorrect Installation

Total Length of Moving Coil with Polarity Sensor

Moving Coil Model SGLFW2-	Length of Moving Coil, L1 (mm)	Length of Polarity Sensor, A (mm)	Total Length, L (mm)

^{*2.} The rated forces are the continuous allowable force values at a ambient temperature of 40°C with an aluminum heat sink of the dimensions given in the following table.
• Heat Sink Dimensions

Linear Servomotors SGLF

Force-Motor Speed Characteristics

Notes:

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. These are typical values.
- 2. The characteristics in the intermittent duty zone depend on the power supply voltage.
- 3. If the effective force is within the allowable range for the rated force, the Servomotor can be used within the intermittent duty zone.
- 4. If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller because the voltage drop increases.

^{*3.} Contact your YASKAWA representative for information on these servopack models.

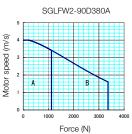

Linear Servomotors SGLF

Force-Motor Speed Characteristics

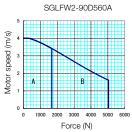

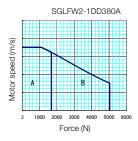

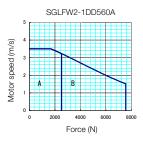

A : Continuous duty zone

With three-phase 400-V input

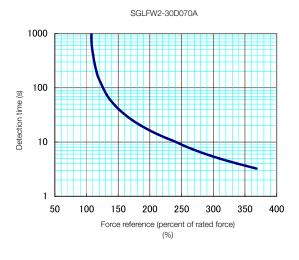

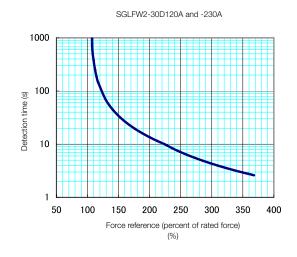

Notes:

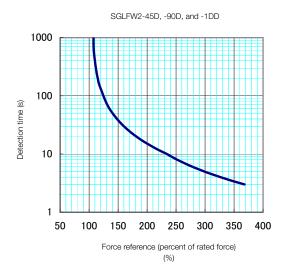

- 1. These values are for operation in combination with a SERVOPACK when the temperature of the armature winding is 100°C. These are typical values.
- 2. The characteristics in the intermittent duty zone depend on the power supply voltage.
- 3. If the effective force is within the allowable range for the rated force, the Servomotor can be used within the intermittent duty zone.
- 4. If you use a Servomotor Main Circuit Cable that exceeds 20 m, the intermittent duty zone in the torque-motor speed characteristics will become smaller because the voltage drop increases.

Servomotor Overload Protection Characteristics

The overload detection level is set for hot start conditions with a Servomotor ambient air temperature of 40°C.

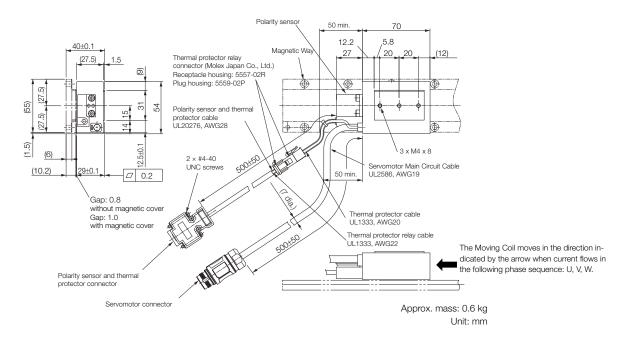

Notes

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher. Use the Servomotor so that the effective force remains within the continuous duty zone given in Force-Motor Speed Characteristics.

SERVOPACK Overload Protection Characteristics

The overload detection level is set for hot start conditions with a SERVOPACK surrounding air temperature of 55°C*.

An overload alarm (A.710 or A.720) will occur if overload operation that exceeds the overload protection characteristics shown in the following diagram (i.e., operation on the right side of the applicable line) is performed.

The actual overload detection level will be the detection level of the connected SERVOPACK or Servomotor that has the lower overload protection characteristics.

In most cases, that will be the overload protection characteristics of the Servomotor.

Instantaneous maximum output current

Continuous output current × 100%

(Instantaneous maximum output current)

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher.

For a YASKAWA-specified combination of SERVOPACK and Servomotor, maintain the effective torque within the continuous duty zone of the torque-motor speed characteristic of the Servomotor.

^{*} However, the range for the SGD7S-370D is -5°C to 40°C.

SERVOPACK Overload Protection Characteristics

The overload detection level is set for hot start conditions with a SERVOPACK surrounding air temperature of 55°C.

An overload alarm (A.710 or A.720) will occur if overload operation that exceeds the overload protection characteristics shown in the following diagram (i.e., operation on the right side of the applicable line) is performed.

The actual overload detection level will be the detection level of the connected SERVOPACK or Servomotor that has the lower overload protection characteristics.

In most cases, that will be the overload protection characteristics of the Servomotor.

Note:

The above overload protection characteristics do not mean that you can perform continuous duty operation with an output of 100% or higher.

For a YASKAWA-specified combination of SERVOPACK and Servomotor, maintain the effective torque within the continuous duty zone of the torque-motor speed characteristic of the Servomotor.

Specifications using EtherCAT Communication Reference

Item			Specification			
Control Method			IGBT-based PWM control, sine wave current drive			
	With Rotary Servomotor		Serial encoder: 24 bits (incremental encoder/absolute encoder)

Option Module Safety

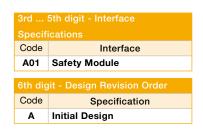

This Safety Module implements safety functions that conform to EN ISO 13849-1 (the harmonized EU Machinery Directive) and are specified in the individual IEC 61800-5-2 standard. You can combine it with a Sigma-7 400V SERVOPACK to design optimum safety in a machine system according to industry needs.

SERVOPACKs, Option Module Safety and Mounting Rail need to be ordered separately. Please use the following model designations.

Option Module Safety

Mounting Rail for Option Cards

Mounting Rail for Option Cards for Sigma-7 400 V SERVOPACKs. Contact your YASKAWA representative for more information.

SERVOPACK Model	Order No.	Specification
All Models	JZSP-P7R2-8-E	6 9 9 9

Applicable Standards and Functions

Compliance with Safety Standards

Safety Standards	Applicable Standards		Products
Salety Standards	Applicable Standards	SERVOPACK	SERVOPACK + Safety Module
Safety of Machinery	EN ISO13849-1:2008/ AC:2009 EN 954-1 IEC 60204-1	J	J
Functional Safety	IEC 61508 Series IEC 62061 IEC 61800-5-2	V	J
EMC	IEC 61326-3-1	J	V

Support for Functions Defined in IEC61800-5-2

Safety functions are implemented by using the hard wire base block (HWBB) in the SERVOPACK.

		Applicable Products			
Safety Function	Description	SGD7S	SGD7S +	SGD7W Axis A +	000714/4 : 0
		SGD7W Axis A + B	Safety Module	Safety Module	SGD7W Axis B
Safe BaseBlock Function* (SBB function)	This safety function is equivalent to an STO function. (It shuts OFF the power supply from the SERVOPACK to the motor.)	J	J	J	J
Safe BaseBlock with Delay Function (SBB-D function)	This safety function is equivalent to an SS1 function. (It monitors the deceleration operation of the motor for the specified time and then shuts OFF the power supply from the SERVOPACK to the motor.)	_	J	J	_
Safe Position Monitor with Delay Function (SPM-D function)	This safety function is equivalent to an SS2 function. (It monitors the deceleration operation of the motor for the specified time and then monitors the position after the motor stops.)	_	J	J	_
Safely Limit Speed with Delay Function (SLS-D function)	This safety function is equivalent to an SLS function. (It monitors the deceleration operation of the motor for the specified time and then monitors the speed of the motor to confirm that it remains in the allowable range.)	_	J	J	_

^{*} In combination with a Option Module Safety, the selection of Safe BaseBlock Function (Safe Torque Off) is possible on SERVOPACK CN8 or Option Module Safety.

SERVOPACK		ERVOPACK Safety Module		Safe Performance: Safety Module
001	D7S	SGDV-OS01A	CN8: Not apply (*2)	Apply
561	0/5	SGDV-OS01A000FT900	CN8: Apply	Apply
SGD7W	Axis A*1	SGDV-OS01A	Apply	Apply

^{*} If Safe Torque Off is used on the SERVOPACK side CN8, the specification of Safe Performance changes to PLe, for specifics refer to the SERVOPACK Specifications in this catalogue.

Top View of SERVOPACK with safety module installed

Device Label	Model	Number of Pins	Manufacturer
CN21	1981080-1	8	Tyco Electronics Japan G.K.
CN22	1981080-1	8	Tyco Electronics Japan G.K.
CN8	1981080-1	8	Tyco Electronics Japan G.K.

Notes:

- 1. The above connectors or their equivalents are used for SERVOPACKs.
- 2. Refer to the user's manual of the Safety Module for installation standards.

Cables for Option Module Safety

Name	Length	Oder No.	Specification
Cables with	1 m	JZSP-CVH03-01-E-G#	三••••••••••••••••••••••••••••••••••••
connectors*	3 m	JZSP-CVH03-03-E-G#	

 $^{^{\}star}$ When using safety functions, connect this Cable to the safety functions devices.

When not using safety functions, connect the enclosed Safety Jumper Connector (JZSP-CVH05-E) to the SERVOPACK.

Specifications for JZSP-CVH03-03-E-G#

Pin No.	Signal	Lead Color	Marking Color
1	Not used	_	-
2	Not used	_	_
3	/HWBB1-	White	Black
4	/HWBB1+	White	Red
5	/HWBB2-	Gray	Black
6	/HWBB2+	Gray	Red
7	EDM1-	Orange	Black
8	EDM1+	Orange	Red

Fully-Closed Module

With fully-closed control, an externally installed encoder is used to detect the position of the controlled machine and the machine's position information is fed back to the SERVOPACK. High-precision positioning is possible because the actual machine position is fed back directly. To perform fully-closed loop control, a Fully-Closed Module and SERVOPACK are required.

SERVOPACKs, Option Module Feedback and Mounting Rail need to be ordered separately. Please use the following model designations.

Model Designation

1st & 2	2nd digit - Module Type
Code	Specification
OF	Option Module Feedback

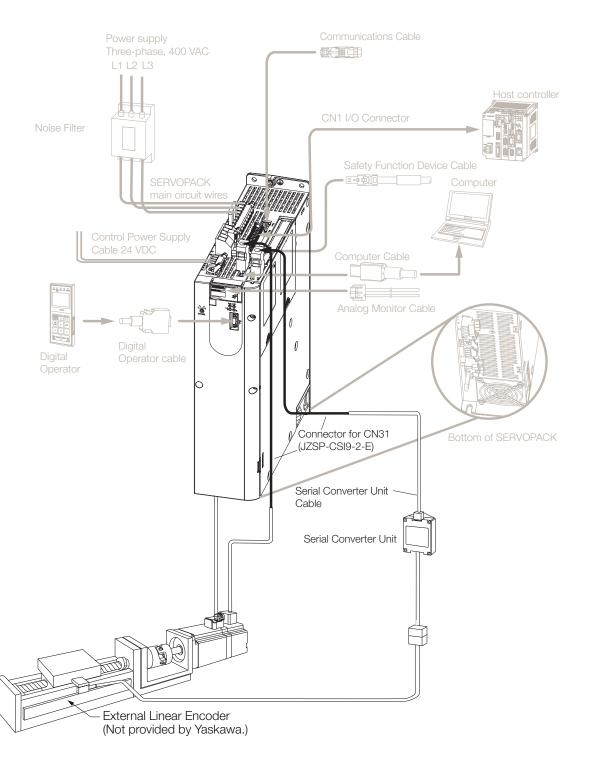

Mounting Rail for Option Cards

Mounting Rail for Option Cards for Sigma-7 400 V SERVOPACKs. Contact your YASKAWA representative for more information.

SERVOPACK Model	Order No.	Specification
All Models	JZSP-P7R2-8-E	

System Configuration with SGDV-OFA01A

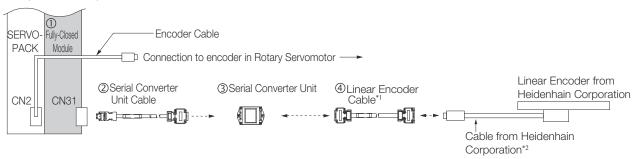

^{*} The connected devices and cables depend on the type of external Linear Encoder that is used.

Note: Refer to the following section for the information on peripheral devices or chapter Peripheral Devices.

Connections to Linear Encoder from Heidenhain Corporation

Connections for a 1 Vp-p Analog Voltage Output Signal

You must make the connections through a YASKAWA Serial Converter Unit. The output signal will be multiplied by 8 bits (256 divisions) in the Serial Converter Unit.

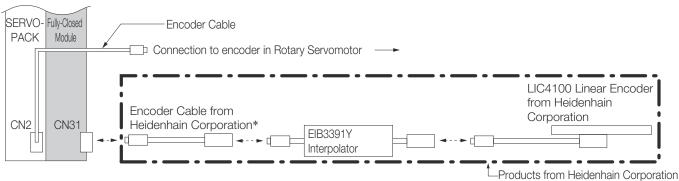

- *1. When using a JZDP-J00□-□□□Serial Converter Unit, do not use a YASKAWA Linear Encoder Cable that is longer than 3 m.
- *2. Contact Heidenhain Corporation for details on cables (analog 1 Vp-p output, D-sub 15-pin, male) from Heidenhain Corporation.

No.	Item	Model
•	Fully-Closed Module (Purchased alone)	Fully-Closed Module*1 SGDV-OFA01A
2	Serial Converter Unit Cable	JZSP-CLP70-□□'3-E
3	Serial Converter Unit ²	JZDP-H003-000
4	Linear Encoder Cable	JZSP-CLL30 -□□ '3-E

^{*1} When ordering a SERVOPACK and a Fully-Closed Module separately, use this Fully-Closed Module model number. Please use the YASKAWA mounting rail JZSP-P7R2-8-E in combination with a Fully-Closed Module.

Connections when using a YASKAWA Serial Interface for the Output Signals

LIC4100 Linear Encoder with EIB3391Y Interpolator

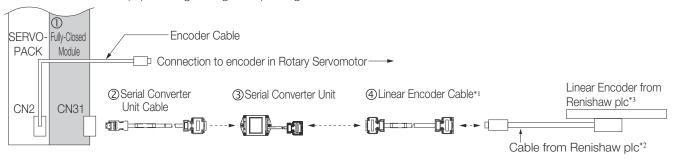

^{*} Use an Encoder Cable from Heidenhain Corporation. Contact Heidenhain Corporation for detailed Encoder Cable specifications.

^{*2} Contact your YASKAWA representative for specific information.

^{*3} The boxes (\square) in the model number are reolaced with cable length when ordering. (1m = 01, 3m = 03, 5m = 05, 10m = 10, 15m = 15)

Connections to Linear Encoder from Renishaw Plc

Connections for a 1 Vp-p Analog Voltage Output Signal

^{*1} When using a JZDP-J00 - DDD Serial Converter Unit, do not use a YASKAWA Linear Encoder Cable that is longer than 3 m.

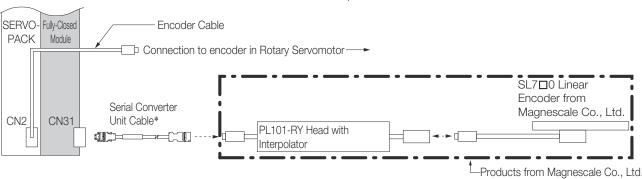

^{*3} If you use the origin signals with a Linear Encoder from Renishaw plc, the origin may sometimes be falsely detected. If that occurs, use the BID/DIR signal to output the origin signal only in one direction.

No.	Item	Model
0	Fully-Closed Module (Purchased alone)	Fully-Closed Module*1 SGDV-OFA01A
2	Serial Converter Unit Cable	JZSP-CLP70-□□'3-E
3	Serial Converter Unit ¹²	JZDP-H005-000
4	Linear Encoder Cable	JZSP-CLL00-□□¹³-E

^{*1} When ordering a SERVOPACK and a Fully-Closed Module separately, use this Fully-Closed Module model number. Please use the YASKAWA mounting rail JZSP-P7R2-8-E in combination with a Fully-Closed Module.

Connections to Linear Encoder from Magnescale Co., Ltd.

SL7 0 Linear Encoder and PL101-RY Sensor Head with Interpolator

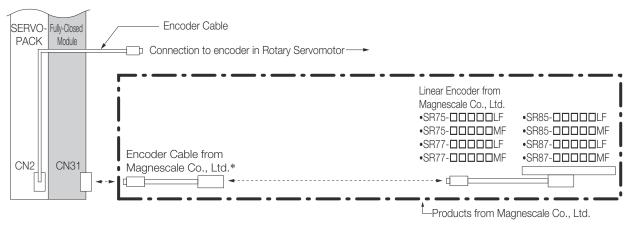

^{*} Refer to the following section for information on cables to connect Fully-Closed Modules and Linear Encoders or chapter Serial Converter Unit Cables.

^{*2} Contact Renishaw plc for details on cables (analog 1 Vp-p output, D-sub 15-pin, male) from Renishaw plc.

^{*2} Contact your YASKAWA representative for specific information.

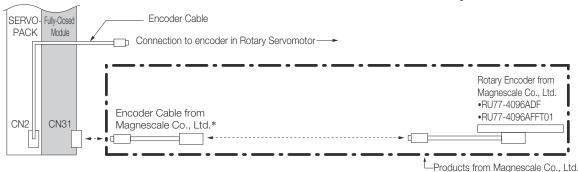

^{*3} The boxes (\square) in the model number are replaced with cable length when ordering. (1m = 01, 3m = 03, 5m = 05, 10m = 10, 15m = 15)

SR-75, SR-77, SR-85, and SR-87 Linear Encoders

^{*} To connect the SERVOPACK and Linear Encoder, use a CH33-xxdd Cable from Magnescale Co., Ltd. (This Cable has connectors designed for use with YASKAWA products).

RU77-4096ADF/RU77-4096AFFT01 Absolute Rotary Encoders

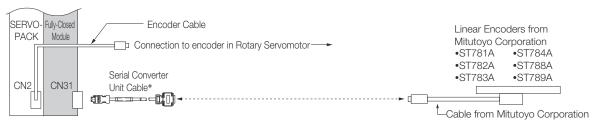

^{*}To connect the SERVOPACK and Rotary Encoder, use a CE28-Series Extension Cable for RU77 from Magnescale Co., Ltd.

Note: The RU77 is a single-turn absolute rotary encoder.

Connections to Linear Encoders from Mitutoyo Corporation

ST78 A Linear Encoders

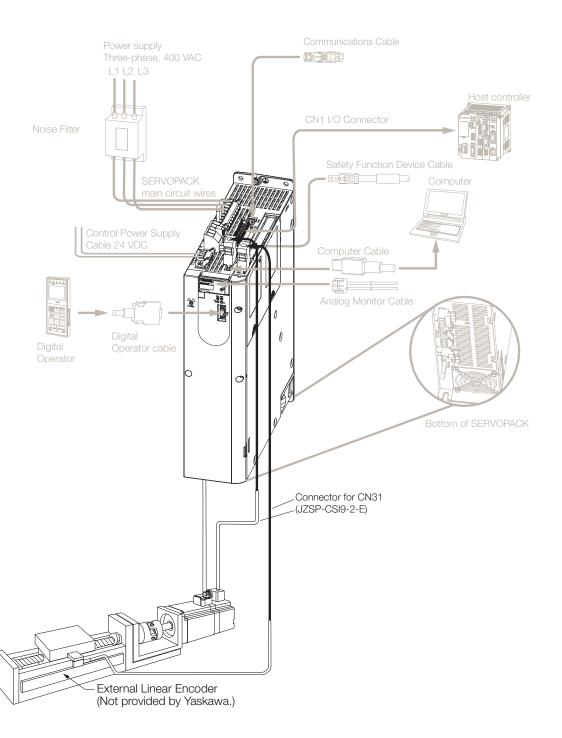

^{*} Refer to the following section for information on cables to connect Fully-Closed Modules and Linear Encoders or chapter Serial Converter Unit Cables.

Connectors

Device Label	Model	Number of Pins	Manufacturer
CN31	3E106-0220KV	6	3M Japan Ltd.

Note: The above connecor or their equivalent are used for the Fully-Closed Module.

	Reference input	Differential voltage	0.2 V or more	
		Terminating resistor	124 Ohm	

Option Module Feedback Set-up for Fully-closepd Loop Control

The encoder parameters must be written into the module via the SERVOPACK using the SigmaWin+engineering tool. Ask Yaskawa for preparation encoder parameter file for fully-closed loop.

Procedure to download the encoder parameter via SigmaWin+Version 7.2x via Sigma-7 400V to Option Module Feedback.

- 1. Install a motor, encoder and SERVOPACK.
- 2. In SigmaWin+ select "Parameters > Parameter edit". Set parameter Pn002.3 = 1 or 3.
- 3. Start "Setup > Motor parameter scale write" in SigmaWin+.
- 4. Write configuration file to option module feedback.

Note: Refer to SigmaWin+ Operation manual for information on how to write parameters using SigmaWin+

General Specification SGDV-OFB01A

	Item	Specification		
Applicable SERVOPACK		All Sigma-7 Series SERVOPACKs		
Applicable SERVOPACK Firmware Version		Version 0023 or later		
Placement		Attached to the SERVOPACK		
Power Specification	Power Supply Method	Supplied from the control power supply of the SERVOPACK.		
	Surrounding Air / Storage Temperature	0°C to +55 °C / -20 °C to +85 °C		
	Ambient / Storage Humidity	90% RH or less (with no condensation)		
	Vibration / Shock Resistance	4.9 m/s ² / 19.8 m/s ²		
Operating Conditions	Protection Class / Pollution Degree	Protection class: IP10, Pollution degree: 2 An environment that satisfies the following conditions. • Free of corrosive or explosive gases • Free of exposure to water, oil or chemicals • Free of dust, salts or iron dust		
	Altitude	1,000 m or less		
	Others	Free of static electricity, strong electromagnetic fields, magnetic fields or exposure to radioactivity		
Supported motors		Permanent magnet, Synchronous AC rotary or linear motor		
Max. output frequency	range	Must be lower than 500 [rev/sec]. Note: UL application: 400 [rev/sec] (200 V), 300 [rev/sec] (400 V). If UL is needed, the combination should be applied to UL on customer side.		
Supported scales for r	notor driving usage	EnDat2.1, EnDat2.2, HIPERFACE, Sin/Cos		
Supported scales for f	ully-closed usage	EnDat2.1, EnDat2.2, HIPERFACE, Sin/Cos		
Motor pole information for motor driving	Without hall sensor signals	Sigma-5 detecting function is available. In case of EnDat2.1, EnDat2.2 and HIPERFACE, the function should be carried out once (after that, recognized data will be used). In other cases, the function should be carried out each boot-up.		
	With hall sensor signals	The data is used (any functions needed for the information).		
Unsupported devices		Advanced option module safety: SGDV-OSA01A Fully-closed option module: SGDV-OFA01A

Molded-case Circuit Breakers and Fuses

Use a molded-case circuit breaker and fuse to protect the power supply line. They protect the power line by shutting OFF the circuit when overcurrent is detected. Select these devices based on the information in the following tables.

Notes:

To comply with the Low Voltage Directive, always connect a fuse to the input side to protect against short-circuit accidents. Select fuses or molded-case circuit breakers that are compliant with UL standards. The following tables provide the net values of the current capacity and inrush current. Select a fuse and a molded-case circuit breaker that meet the following conditions.

- Main circuit and control circuit: No breaking at three times the current value given in the table for 5s.
 Inrush current: No breaking at the current value given in the table for 20ms.

Main Circuit Power Supply	Maximum Applicable Motor Capacity [kW]	Model		Power Supply	Current Capacity		Inrush Current	
		SGD7S-	SGD7W-	Capacity per SERVOPACK [kVA]	Main Circuit [Arms]	Control Power Supply [Arms]	Main Circuit [A0-p]	Control Power Supply [A0-p]

SERVOPACK Main Circuit Wires

This section describes the main circuit wires for SERVOPACKs.

These specifications are based on IEC/EN 61800-5-1, UL 61800-5-1, and CSA C22.2 No.14.

- 1. To comply with UL standards, use UL-compliant wires.
- 2. Use copper wires with a rated temperature of 75° or higher.
- 3. Use copper wires with a rated withstand voltage of 300 V or higher.

- To use 600-V heat-resistant polyvinyl chloride-insulated wire (HIV), use the following table as reference for the applicable wires.

 The specified wire sizes are for three bundled leads when the rated current is applied with a surrounding air temperature of 40°C.
- Select the wires according to the ambient temperature.

Three Phase, 400 V Wires for SGD7S SERVOPACKs

	Terminal	SERVOPACK Model SGD7S-									
Cables	Symbol	1R9D	3R5D	5R4D	8R4D	120D	170D	210D	260D	280D	370D
Main Circuit Power Cable	L1, L2, L3	AWG ⁻	16 (or 1.5	mm²)	AWG 14 (d	or 2.5 mm²)	AWG 12 (or 4.0 mm²)				
Servomotor Main Circuit Cable	U, V, W	AWG 1	16 (or 1.5	mm²)	AWG 14 (d	or 2.5 mm²)	AWG 12 (or 4.0 mm²)				
Control Power Cable	24V, 0V		AWG 16 (or 1.5 mm²)								
External Regenerative Resistor Cable	B1/ ⊕,B2		AWG 16 (or 1.5 mm²)								
Ground Cable	(AW	'G 14 (or 2.5	5 mm²)	AWG 12 (or 4.0 mm ²)				

Three Phase, 400V Wires for SGD7W SERVOPACKs

		SERVOPACK Model SGD7W-			
Cables	Terminal Symbol	2R9D	5R4D		
Main Circuit Power Cable	L1, L2, L3	AWG 14 (or 2.5 mm²)			
Servomotor Main Circuit Cable	U, V, W	AWG 16 (or 1.5 mm²)			
Control Power Cable	24V, 0V	AWG 16 (o	r 1.5 mm²)		
External Regenerative Resistor Cable	B1/ ⊕,B2	AWG 16 (o	r 1.5 mm²)		
Ground Cable	(b)	AWG 14 (o	r 2.5 mm²)		

Wire Types

The following table shows the wire sizes and allowable currents for three bundled leads.

HIV Specification	ns*	Allowable Current at Ambient Temperatures [Arms]			
Nominal Cross-selectional Area [mm²]	Configuration [Wires/mm²]	30°C	40°C	50°C	
0.9	37/0.18	15	13	11	
1.25	50/0.18	16	14	12	
2.0	7/0.6	23	20	17	
3.5	7/0.8	32	28	24	
5.5	7/1.0	42	37	31	
8.0	7/1.2	52	46	39	
14.0	7/1.6	75	67	56	
22.0	7/2.0	98	87	73	

^{*} This is reference data based on JIS C3317 600-V-grade heat-resistant polyvinyl chloride-insulated wires (HIV).

Surge Absorbers for Holding Brakes (Varistors) and Diodes

Surge Absorbers for Holding Brakes (Varistors)

Select an appropriate Surge Absorber for the power supply voltage and current of the brake. Surge absorbers are not provided by YASKAWA.

Brake Power Supply Voltage		24 VDC	
Surge Absorber Manu	facturer	Nippon Chemi-Con Corporation	SEMITEC Corporation
	1 A max.	TNR5V121K	Z5D121
D 1 D 1 10	2 A max.	TNR7V121K	Z7D121
Brake Rated Current	4 A max.	TNR10V121K	Z10D121
	8 A max.	TNR14V121K	Z15D121

Regenerative Resistors

Types of Regenerative Resistors

The following regenerative resistors can be used:

- Built-in regenerative resistors: Some models of SERVOPACKs have regenerative resistors built into them.
- External regenerative resistors: These resistors are used when the internal capacitor and built-in regenerative resistor in the SERVOPACK cannot consume all of the regenerative power.
 Use Yaskawa's SigmaSize+, an AC Servo drive capacity selection program, to determine if a regenerative resisitor is required.

Note: If you use an external regenerative resistor, you must change the setting parameter Pn600.

Built-In Regenerative Resistor

The following table gives the specifications of the built-in regenerative resistors in the SERVOPACKs and the amount of regenerative power (average values) that they can process. A built-in regenerative resistor is provided as a standard feature. Install an external regenerative resistor when the built-in regenerative resistor cannot process all the regenerative power.*

SERVOPA	Built-In Regenerative Resistor				
SGD7S-	SGD7W-	Resistance [Ω]	Capacity [W]	Minimum Allowable Resistance $[\Omega]$

Note:

Contact your YASKAWA representative for information on Sigma-7 400V Dynamic Brake Resistors.

Calculate the energy that must be consumed by the resistance for one dynamic brake stop. To simplify the energy consumption calculation, assume that all the kinetic energy until the Servomotor stops is consumed by the dynamic brake resistor and use the following formula. Out of all possible operation patterns, use the one which maximizes the kinetic energy of the Servomotor.

Rotary Servomotors

Energy consumption of the dynamic brake resistor: $E_{\rm DB}$ [J] Motor moment of inertia*: $J_{\rm M}$ [kgm2]

Load inertia: J_L [kgm2]

Motor speed just before stopping with the dynamic brake: N [min-1]

Linear Servomotors

Energy consumption of the dynamic brake resistor: E_{DB} [J]

Moving Coil mass*: m_M [kg]

Load mass: m_L [kg]

Motor speed just before stopping with the dynamic brake: v [m/s]

$$E_{DB} = \frac{1}{2} \times \left(J_M + J_L \right) \times \left(\frac{2\pi}{60} \times N \right)^2$$

$$E_{DB} = \frac{1}{2} \times (m_M + m_L) \times v^2$$

^{*} For detailed information on the motor moment of inertia, refer to the catalog or Servomotor product manual.

^{*} For detailed information on Moving Coil mass, refer to the catalog or Servomotor product manual.

Batteries for Servomotors with Absolute Encoders

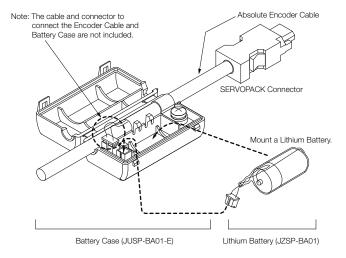

If you use an absolute encoder, you can use an Encoder Cable with a Battery Case connected to it to supply power and retain the absolute position data.

You can also retain the absolute position data by supplying power from a battery on the host controller. The Battery Case is sold as a replacement part for the Battery Case that is included with an Absolute Encoder Cable.

Name	Order Number	Remarks
Battery case (case only)	JUSP-BA01-E	The Encoder Cable and Battery are not included. (This is a replacement part for a damaged Battery Case.)
Lithium Battery	JZSP-BA01	This is a special battery that mounts into the Battery Case.

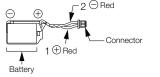

- 1. You cannot attach the Battery Case to an Incremental Encoder Cable.
- 2. Install the Battery Case where the ambient temperature is between -5°C and 60°C.

Mounting a Battery in the Battery Case

Obtain a Lithium Battery (JZSP-BA01) and mount it in the Battery Case.

ER3V (3.6 V, 1000 mAh) from Toshiba Battery Co., Ltd.

Connecting a Battery to the Host Controller

Use a battery that meets the specifications of the host controller. Use an ER6VC3N Battery (3.6 V, 2,000 mAh) from Toshiba Battery Co., Ltd. or an equivalent battery.

Software

SigmaSize+: AC Servo Capacity Selection Program

You can use the SigmaSize+ to select Servomotors and SERVOPACKs. There are two versions of the software: A Web-based version and a stand-alone version.

The software supports all standard servo products sold by Yaskawa.

Features

- Provides a vast amount of new product information.
- Lets you select servo products with a wizard.
- As long as you have a connection to the Internet, you can access and use the software anytime, anywhere. (Communications are encrypted for security)
- You can access and reuse previously entered data.

System Requirements

Item	System Requirement
Browser (Required for web-based version only)	Internet Explorer 5.0 SP1 or higher
OS	Windows XP, Windows Vista, or Windows 7 (32-bit or 64-bit edition)
CPU	Pentium 200 MHz min.
Memory	64 MB min. (96 MB or greater recommended)
Available Hard Disk Space	20 MB min.

SigmaWin+ Version 7: AC Servo Drive Engineering Tool

The SigmaWin+ Engineering Tool is used to set up and optimally tune Yaskawa Sigma-series Servo Drives.

Features

- Set parameters with a wizard.
- Display SERVOPACK data on a computer just like you would on an oscilloscope.
- Estimate moments of inertia and measure vibration frequencies.
- Display alarms and alarm diagnostics.

Warranty	153

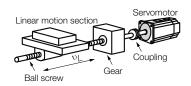

Selecting the Servomotor Capacity

Use Yaskawa's SigmaSize+, an AC servo drive capacity selection program, to select Servomotor capacity. With the SigmaSize+, you can find the optimum Servomotor capacity by simply selecting and entering information according to instructions from a wizard.

If you select a Servomotor capacity with a formula, refer to the following selecation examples.

Capacity Selection Example for a Rotary Servomotor: For Speed Control

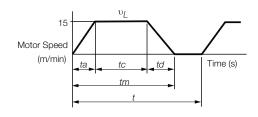

1. Mechanical Specifications

Item	Code	Value
Load Speed	$ u_{L}$	15 m/min
Linear Motion Section Mass	m	250 kg
Ball Screw Length	ℓ_{B}	1.0 m
Ball Screw Diameter	d _B	0.02 m
Ball Screw Lead	P_B	0.01 m
Ball Screw Material Density	ρ	$7.87 \times 10^3 \text{kg/m}^3$
Gear Ratio	R	2 (gear ratio: 1/2)
External Force on Linear Motion Section	F	0 N

Item	Code	Value
Gear and Coupling Moment of Inertia	J_{G}	$0.40 \times 10^{-4} \mathrm{kg \cdot m^2}$
Number of Feeding Operations	n	40 rotations/min
Feeding Distance	l	0.275 m
Feeding Time	tm	1.2 s max.
Friction Coefficient	μ	0.2
Mechanical Efficiency	η	0.9 (90%)

2. Speed Diagram

$$t = \frac{60}{n} = \frac{60}{40} = 1.5 \text{ (s)}$$

If ta = td,

$$ta = tm - \frac{60 \,\ell}{^{\circ}L} = 1.2 - \frac{60 \times 0.275}{15} = 1.2 - 1.1 = 0.1 \text{ (s)}$$

$$tc = 1.2 - 0.1 \times 2 = 1.0 \text{ (s)}$$

3. Motor Speed

Load shaft speed

$$n_L = \frac{v_L}{P_B} = \frac{15}{0.01} = 1,500 \text{ (min}^{-1}\text{)}$$

Motor shaft speed

$$n_M = n_L \cdot R = 1,500 \times 2 = 3,000 \text{ (min}^{-1})$$

4. Load Torque

$$T_L = \frac{(9.8 \cdot \mu \cdot m + F) \cdot P_B}{2\pi R \cdot \eta} = \frac{(9.8 \times 0.2 \times 250 + 0) \times 0.01}{2\pi \times 2 \times 0.9} = 0.43 \text{ (N} \cdot \text{m)}$$

5. Load Moment of Inertia

Linear motion section

$$J_{L1} = m \left(\frac{P_B}{2\pi R}\right)^2 = 250 \times \left(\frac{0.01}{2\pi \times 2}\right)^2 = 1.58 \times 10^{-4} \text{ (kg·m}^2\text{)}$$

Ball screw

$$J_B = \frac{\pi}{32} \ \rho \cdot \ell_B \cdot d_B^4 \cdot \frac{1}{R^2} = \frac{\pi}{32} \times 7.87 \times 10^3 \times 1.0 \times (0.02)^4 \cdot \frac{1}{2^2} = 0.31 \times 10^{-4} \ (\text{kg} \cdot \text{m}^2)$$

Coupling $J_G = 0.40 \times 10^{-4} \text{ (kg m}^2\text{)}$

Load moment of inertia at motor shaft

$$J_L = J_{L1} + J_B + J_G = (1.58 + 0.31 + 0.40) \times 10^{-4} = 2.29 \times 10^{-4} \text{ (kg·m}^2)$$

6. Load Moving Power

$$P_O = \frac{2\pi n_M \cdot T_L}{60} = \frac{2\pi \times 3,000 \times 0.43}{60} = 135 \text{ (W)}$$

7. Load Acceleration Power

$$Pa = \left(\frac{2\pi}{60} n_{M}\right)^{2} \frac{J_{L}}{ta} = \left(\frac{2\pi}{60} \times 3,000\right)^{2} \times \frac{2.29 \times 10^{-4}}{0.1} = 226 \text{ (W)}$$

8. Servomotor Provisional Selection

① Selection Conditions

 $T_L \leq \text{Motor rated torque}$

$$\frac{(Po + Pa)}{2}$$
 < Provisionally selected Servomotor rated output < $(Po + Pa)$

 $n_M \le \text{Rated motor speed}$

 $J_1 \leq$ Allowable load moment of inertia

The following Servomotor meets the selection conditions.

SGM7J-02A Servomotor

② Specifications of the Provisionally Selected Servomotor

Item	Value
Rated Output	200 (W)
Rated Motor Speed	3,000 (min ⁻¹)
Rated Torque	0.637 (N·m)
Instantaneous Maximum Torque	2.23 (N·m)
Motor Moment of Inertia	$0.263 \times 10^{-4} \text{ (kg} \cdot \text{m}^2\text{)}$
Allowable Load Moment of Inertia	$0.263 \times 10^{-4} \times 15 = 3.94 \times 10^{-4} \text{ (kg} \cdot \text{m}^2\text{)}$

9. Verification of the Provisionally Selected Servomotor

Verification of required acceleration torque:

$$T_P = \frac{2\pi n_M (J_M + J_L)}{60ta} + T_L = \frac{2\pi \times 3,000 \times (0.263 + 2.29) \times 10^{-4}}{60 \times 0.1} + 0.43$$

 \approx 1.23 (N·m) < Maximum instantaneous torque...Satisfactory

Verification of required deceleration torque:

$$T_{S} = \frac{2\pi n_{M} (J_{M} + J_{L})}{60td} - T_{L} = \frac{2\pi \times 3,000 \times (0.263 + 2.29) \times 10^{-4}}{60 \times 0.1} - 0.43$$

≈ 0.37 (N·m) < Maximum instantaneous torque...Satisfactory

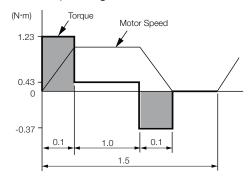

Verification of effective torque value:

$$Trms = \sqrt{\frac{T_P^2 \cdot ta + T_L^2 \cdot tc + Ts^2 \cdot td}{t}} = \sqrt{\frac{(1.23)^2 \times 0.1 + (0.43)^2 \times 1.0 + (0.37)^2 \times 0.1}{1.5}}$$

≈ 0.483 (N·m) < Rated torque...Satisfactory

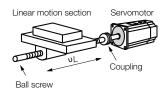

10. Result

It has been verified that the provisionally selected Servomotor is applicable. The torque diagram is shown below.

Capacity Selection Example for a Rotary Servomotor: For Position Control

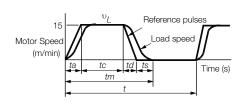

1. Mechanical Specifications

Item	Code	Value
Load Speed	$\nu_{\!\scriptscriptstyle L}$	15 m/min
Linear Motion Section Mass	m	80 kg
Ball Screw Length	ℓ_{B}	0.8 m
Ball Screw Diameter	d _B	0.016 m
Ball Screw Lead	P_B	0.005 m
Ball Screw Material Density	ρ	$7.87 \times 10^3 \text{ kg/m}^3$
External Force on Linear Motion Section	F	0 N
Coupling Mass	m_C	0.3 kg

Item	Code	Value
Coupling Outer Diameter	$d_{\mathbb{C}}$	0.03 m
Number of Feeding Operations	n	40 rotation/min
Feeding Distance	l	0.25 m
Feeding Time	tm	1.2 s max.
Electrical Stopping Precision	δ	±0.01 mm
Friction Coefficient	μ	0.2
Mechanical Efficiency	η	0.9 (90%)
·		

2. Speed Diagram

$$t = \frac{60}{n} = \frac{60}{40} = 1.5$$
 (s)

If ta = td and ts = 0.1 (s),

$$ta = tm - ts - \frac{60 \,\ell}{v_L} = 1.2 - 0.1 - \frac{60 \times 0.25}{15} = 0.1$$
 (s)

$$tc = 1.2 - 0.1 - 0.1 \times 2 = 0.9$$
 (s)

3. Motor Speed

Load shaft speed

$$n_L = \frac{v_L}{P_B} = \frac{15}{0.005} = 3,000 \text{ (min}^{-1}\text{)}$$

Motor shaft speed

Direct coupling gear ratio 1/R = 1/1

Therefore, $n_M = n_L$ R = 3,000 × 1 = 3,000 (min⁻¹)

4. Load Torque

$$T_L = \frac{(9.8 \ \mu \cdot m + F) \cdot P_B}{2\pi R \cdot n} = \frac{(9.8 \times 0.2 \times 80 + 0) \times 0.005}{2\pi \times 1 \times 0.9} = 0.139 \text{ (N·m)}$$

5. Load Moment of Inertia

Linear motion section

$$J_{L1} = m \left(\frac{P_B}{2\pi R}\right)^2 = 80 \times \left(\frac{0.005}{2\pi \times 1}\right)^2 = 0.507 \times 10^{-4} \text{ (kg} \cdot \text{m}^2\text{)}$$

Ball screw
$$J_B = \frac{\pi}{32} \rho \cdot \ell_B \cdot d_B^4 = \frac{\pi}{32} \times 7.87 \times 10^3 \times 0.8 \times (0.016)^4 = 0.405 \times 10^{-4} \text{ (kg·m}^2)$$

Coupling
$$Jc = \frac{1}{8} m_{\text{C}} \cdot d_{\text{C}}^2 = \frac{1}{8} \times 0.3 \times (0.03)^2 = 0.338 \times 10^{-4} \text{ (kg·m}^2)$$

Load moment of inertia at motor shaft

$$J_L = J_{L1} + J_B + Jc = 1.25 \times 10^{-4} \text{ (kg} \cdot \text{m}^2\text{)}$$

6. Load Moving Power

$$P_O = \frac{2\pi n_M \cdot T_L}{60} = \frac{2\pi \times 3,000 \times 0.139}{60} = 43.7 \text{ (W)}$$

7. Load Acceleration Power

$$Pa = \left(\frac{2\pi}{60} n_{M}\right)^{2} \frac{J_{L}}{ta} = \left(\frac{2\pi}{60} \times 3,000\right)^{2} \times \frac{1.25 \times 10^{-4}}{0.1} = 123.4 \text{ (W)}$$

8. Servomotor Provisional Selection

① Selection Conditions

 $T_1 \leq Motor rated torque$

$$\frac{(Po + Pa)}{2}$$
 < Provisionally selected Servomotor rated output < $(Po + Pa)$

 $n_M \leq$ Rated motor speed

 $J_L \leq$ Allowable load moment of inertia

The following Servomotor meets the selection conditions.

SGM7J-01A Servomotor

2 Specifications of the Provisionally Selected Servomotor

Item	Value
Rated Output	200 (W)
Rated Motor Speed	3,000 (min ⁻¹)
Rated Torque	0.318 (N·m)
Instantaneous Maximum Torque	1.11 (N·m)
Motor Moment of Inertia	$0.0659 \times 10^{-4} \text{ (kg} \cdot \text{m}^2\text{)}$
Allowable Load Moment of Inertia	$0.0659 \times 10^{-4} \times 35 = 2.31 \times 10^{-4} \text{ (kg·m}^2\text{)}$
Encoder Resolution	24 bits (16,777,216 pulses/rev)

Capacity Selection for Servomotors

9. Verification of the Provisionally Selected Servomotor

Verification of required acceleration torque:

$$T_P = \frac{2\pi n_M (J_M + J_L)}{60ta} + T_L = \frac{2\pi \times 3,000 \times (0.0659 + 1.25) \times 10^{-4}}{60 \times 0.1} + 0.139$$

 \approx 0.552 (N·m) < Maximum instantaneous torque...Satisfactory

Verification of required deceleration torque:

$$T_{S} = \frac{2\pi n_{M} (J_{M} + J_{L})}{60td} - T_{L} = \frac{2\pi \times 3,000 \times (0.0659 + 1.25) \times 10^{-4}}{60 \times 0.1} - 0.139$$

≈ 0.274 (N·m) < Maximum instantaneous torque...Satisfactory

Verification of effective torque value:

$$Trms = \sqrt{\frac{T_P{}^2 \cdot ta + T_L{}^2 \cdot tc + Ts^2 \cdot td}{t}} = \sqrt{\frac{(0.552)^2 \times 0.1 + (0.139)^2 \times 0.9 + (0.274)^2 \times 0.1}{1.5}}$$

≈ 0.192 (N·m) < Rated torque...Satisfactory

It has been verified that the provisionally selected Servomotor is applicable in terms of capacity. Position control is considered next.

10. Position Detection Resolution

Position detection unit: $\Delta^{\ell} = 0.01$ mm/pulse

The number of pulses per motor rotation must be less than the encoder resolution (pulses/rev).

The number of pulses per revolution (pulses) =
$$\frac{P_B}{\Delta^{\ell}} = \frac{5 \text{ mm}}{0.01 \text{ mm}} = 500 < \text{Encoder resolution [16777216 (pulses/rev)]}$$

11. Reference Pulse Frequency

$$vs = \frac{1,000 \text{ }^{\text{D}}L}{60 \times \Delta_{\ell}} = \frac{1,000 \times 15}{60 \times 0.01} = 25,000 \text{ (pps)}$$

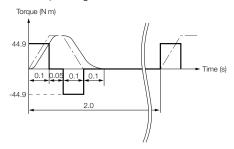

Confirm that the maximum input pulse frequency is greater than the reference pulse frequency.

Refer to the specifications in the SERVOPACK manual for the maximum input pulse frequency.

It has been verified that the provisionally selected Servomotor is applicable for position control.

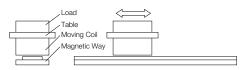

8. Result

It has been verified that the provisionally selected Servomotor is applicable. The torque diagram is shown below.

Servomotor Capacity Selection Example for Linear Servomotors

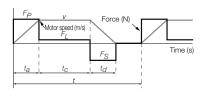

1. Mechanical Specifications

Item	Code	Value
Load Mass	m_W	1 kg
Table Mass	m_T	2 kg
Motor Speed	V	2 m/s
Feeding Distance	1	0.76 m
Friction Coefficient	μ	0.2

Item	Code	Value
Acceleration Time	t _a	0.02 s
Constant-speed Time	t _C	0.36 s
Deceleration Time	t _d	0.02 s
Cycle Time	t	0.5 s
External Force on Linear Motion Section	F	0 N

2. Operation Pattern

3. Steady-State Force (Excluding Servomotor Moving Coil)

$$F_L = \{9.8 \times \mu \times (m_W + m_T)\} + F = 9.8 \times 0.2 \times (1 + 2) + 0 = 5.88 \text{ (N)}$$

4. Acceleration Force (Excluding Servomotor Moving Coil)

$$F_P = (m_W + m_T) \times \frac{v}{t_a} + F_L = (1 + 2) \times \frac{2}{0.02} + 5.88 = 305.88 \text{ (N)}$$

- 5. Provisional Selection of Linear Servomotor
 - ① Selection Conditions

 $F_P \leq \text{Maximum force} \times 0.9$

 $F_s \leq \text{Maximum force} \times 0.9$

 $F_{rms} \le \text{Rated force} \times 0.9$

Capacity Selection for Servomotors

2 Specifications of the Provisionally Selected Servomotor

Item	Value
Maximum Force	440 (N)
Rated Force	147 (N)
Moving Coil Mass (m_M)	0.82 (kg)
Servomotor Magnetic Attraction (Fatt)	0 (N)

6. Verification of the Provisionally Selected Servomotor

Steady-State Force

$$F_L = \mu \{9.8 \times (m_W + m_T + m_M) + F_{att}\} = 0.2 \{9.8 \times (1 + 2 + 0.82) + 0\} = 7.5 \text{ (N)}$$

Verification of Acceleration Force

$$F_P = (m_W + m_T + m_M) \times \frac{v}{t_a} + F_L = (1 + 2 + 0.82) \times \frac{2}{0.02} + 7.5$$

= 389.5 (N) ≤ Maximum force × 0.9 (= 396 N)... Satisfactory

Verification of Deceleration Force

$$F_S = (m_W + m_T + m_M) \times \frac{v}{t_a} - F_L = (1 + 2 + 0.82) \times \frac{2}{0.02} - 7.5$$

= 374.5 (N) ≤ Maximum force × 0.9 (= 396 N)... Satisfactory

Verification of Effective Force

$$F_{rms} = \sqrt{\frac{F_P{}^2 \cdot t_a + F_L{}^2 \cdot t_c + F_S{}^2 \cdot t_d}{t}} = \sqrt{\frac{389.5^2 \times 0.02 + 7.5^2 \times 0.36 + 374.5^2 \times 0.02}{0.5}}$$

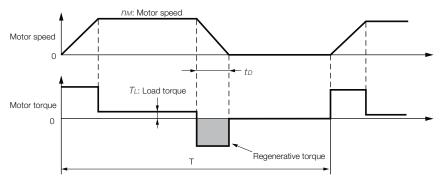

7. Result

It has been verified that the provisionally selected Servomotor is applicable.

Capacity Selection for Regenerative Resistors

Calculating the Regenerative Energy

This section shows how to calculate the regenerative resistor capacity for the acceleration/deceleration operation shown in the following figure.

Calculation Procedure for Regenerative Resistor Capacity

Step	Item	Code	Formula
1	Calculate the rotational energy of the Servo- motor.	E _S	$E_{\mathcal{S}} = J n_{\mathcal{M}}^2 / 182$
2	Calculate the energy consumed by load loss during the deceleration period	E _L	$E_L = (\pi/60) n_M T_L t_D$ Note: If the load loss is unknown, calculate the value with E_L set to 0.
3	Calculate the energy lost from Servomotor winding resistance.	E _M	(Value calculated from the graphs in \clubsuit Servomotor Winding Resistance Loss on page 271) $\times t_D$
4	Calculate the energy that can be absorbed by the SERVOPACK.	E _C	Calculate from the graphs in ◆ SERVOPACK- absorbable Energy on page 270
5	Calculate the energy consumed by the regenerative resistor.	E _K	$E_K = E_S - (E_L + E_M + E_C)$ $E_K = E_S - (E_L + E_M + E_C) + E_G$ Note: Use this formula if there will be continuous periods of regenerative operation, such as for a vertical axis.
6	Calculate the required regenerative resistor capacity (W).	W_K	$W_K = E_K/(0.2 \times T)$

 E_{G} (joules): Energy for continuous period of regenerative operation

 $E_G = (2\pi/60) \, n_{MG} T_G t_G$

 $T_{\rm G}$: Servomotor's generated torque in continuous period of regenerative operation (N m)

 n_{MG} : Servomotor's motor speed for same operation period as above (min⁻¹)

 t_G : Same operation period as above (s)

Note: 1. The 0.2 in the equation for calculating W_K is the value when the regenerative resistor's utilized load ratio is

2. The units for the various symbols are given in the following table.

Code	Description
E_S to E_K	Energy in joules (J)
W_K	Required regenerative resistor capacity (W)
J	$=J_M+J_L~(\mathrm{kg}\cdot\mathrm{m}^2)$
n_M	Servomotor motor speed (min ⁻¹)

Code	Description
T_L	Load torque (N m)
t_D	Deceleration stopping time (s)
Т	Servomotor repeat operation cycle (s)

If the value of W_K does not exceed the capacity of the built-in regenerative resistor of the SERVO-PACK, an External Regenerative Resistor is not required. For details on the built-in regenerative resisters, refer to the SERVOPACK specifications. If the value of W_K exceeds the capacity of the built-in regenerative resistor, install an External Regenerative Resistor with a capacity equal to the value for W calculated above.

Details of Warranty

Warranty Period

The warranty period for a product that was purchased (hereinafter called the "delivered product") is one year from the time of delivery to the location specified by the customer or 18 months from the time of shipment from the Yaskawa factory, whichever is sooner.

Warranty Scope

YASKAWA shall replace or repair a defective product free of charge if a defect attributable to YASKAWA occurs during the above warranty period.

This warranty does not cover defects caused by the delivered product reaching the end of its service life and r eplacement of parts that require replacement or that have a limited service life.

This warranty does not cover failures that result from any of the following causes.

- Improper handling, abuse, or use in unsuitable conditions or in environments not described in product catalogs or manuals, or in any separately agreed-upon specifications
- Causes not attributable to the delivered product itself
- Modifications or repairs not performed by YASKAWA
- Use of the delivered product in a manner in which it was not originally intended
- Causes that were not foreseeable with the scientific and technological understanding at the time of shipment from YASKAWA
- Events for which YASKAWA is not responsible, such as natural or human-made disasters

Limitations of Liability

- YASKAWA shall in no event be responsible for any damage or loss of opportunity to the customer that arises due to failure of the delivered product.
- YASKAWA shall not be responsible for any programs (including parameter settings) or the results of program execution of the programs provided by the user or by a third party for use with programmable Yaskawa products.
- The information described in product catalogs or manuals is provided for the purpose of the customer purchasing
 the appropriate product for the intended application. The use thereof does not guarantee that there are no infringements of intellectual property rights or other proprietary rights of Yaskawa or third parties, nor does it construe a
 license.
- YASKAWA shall not be responsible for any damage arising from infringements of intellectual property rights or other proprietary rights of third parties as a result of using the information described in catalogs or manuals.

Suitability for Use

- It is the customer's responsibility to confirm conformity with any standards, codes, or regulations that apply if the YASKAWA product is used in combination with any other products.
- The customer must confirm that the YASKAWA product is suitable for the systems, machines, and equipment used by the customer.
- Consult with YASKAWA to determine whether use in the following applications is acceptable. If use in the application is acceptable, use the product with extra allowance in ratings and specifications, and provide safety measures to minimize hazards in the event of failure.
 - Outdoor use, use involving potential chemical contamination or electrical interference, or use in conditions or environments not described in product catalogs or manuals
 - Nuclear energy control systems, combustion systems, railroad systems, aviation systems, vehicle systems, medical equipment, amusement machines, and installations subject to separate industry or government regulations
 - Systems, machines, and equipment that may present a risk to life or property
 - Systems that require a high degree of reliability, such as systems that supply gas, water, or electricity, or systems that operate continuously 24 hours a day
 - Other systems that require a similar high degree of safety

Warranty

- Never use the product for an application involving serious risk to life or property without first ensuring that
 the system is designed to secure the required level of safety with risk warnings and redundancy, and that the
 YASKAWA product is properly rated and installed
- The circuit examples and other application examples described in product catalogs and manuals are for reference. Check the functionality and safety of the actual devices and equipment to be used before using the product
- Read and understand all use prohibitions and precautions, and operate the Yaskawa product correctly to prevent accidental harm to third parties

Specifications Change

The names, specifications, appearance, and accessories of products in product catalogs and manuals may be changed at any time based on improvements and other reasons. The next editions of the revised catalogs or manuals will be published with updated code numbers. Consult with your YASKAWA representative to confirm the actual specifications before purchasing a product.
